

# Getting Started with <cfalexa>

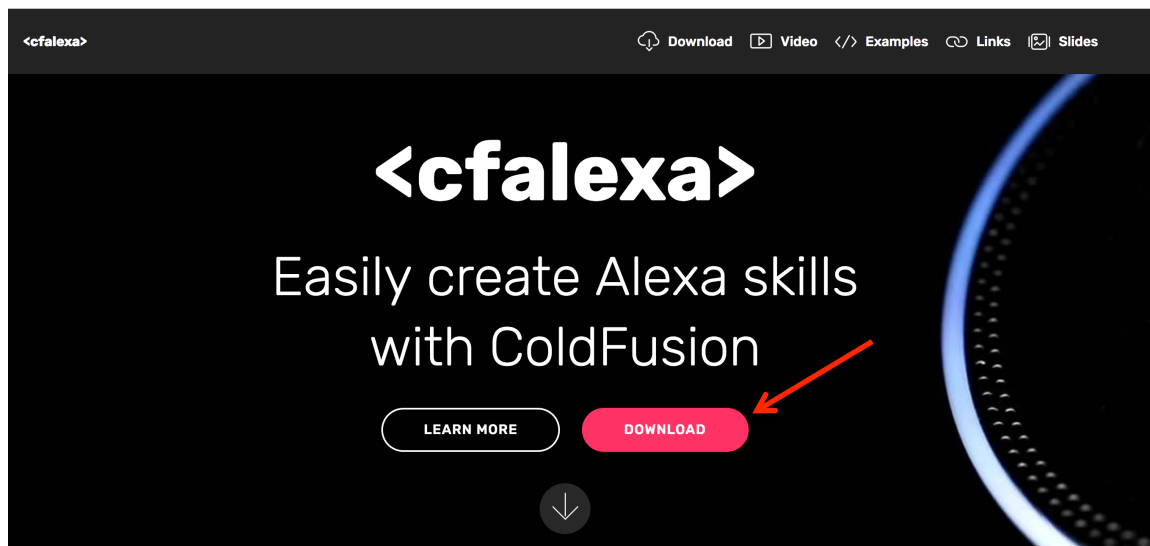

**Note:** Amazon Alexa requires the ability to connect to your ColdFusion website. Therefore, you **MUST** have a site available to the general public when building Alexa skills. A developers version of ColdFusion running on your laptop or desktop **WILL NOT** work.

Also, your site must support HTTP over SSL/TLS, leveraging an Amazon-trusted certificate. For testing, Amazon accepts different methods for providing a certificate. For details, see [About the SSL Options](#). For more information about requirements, see [Requirements for Your Web Service](#).

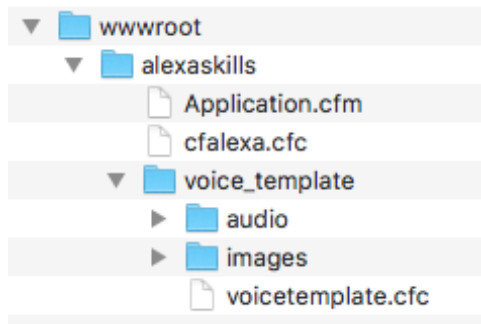

---

## Let's Begin.

Go to [www.cfalexa.com](http://www.cfalexa.com) and download cfalexa.

Unzip the code into the root folder of your ColdFusion web site.

Log in to the developer console at <https://developer.amazon.com/alexa/console/ask>. If you have purchased any Alexa devices through Amazon, make sure to log in using the same ID you used when you purchased your device.

Click on the “Create Skill” button.

A screenshot of the Amazon Alexa Developer Console. The browser address bar shows 'https://developer.amazon.com/alexa/console/ask?'. The page has a dark blue header with the 'amazon alexa' logo and navigation links. Below the header is a light blue banner with a welcome message and a 'Switch to old console' button. The main content area is titled 'Alexa Skills' and features a red arrow pointing to a blue 'Create Skill' button. Below this is a table listing existing skills.

Enter “voicetemplate” for skill name. Make sure the “custom” card is selected. Click the “Create Skill” button.

alex developer console

Create a new skill

Cancel Create skill

Skill name

voicetemplate

Skill name must have at least 2 characters. 13/50 characters

Default language

English (US)

More languages can be added to your skill after creation

Choose a model to add to your skill

There are many ways to start building a skill. You can design your own custom model or start with a pre-built model. Pre-built models are interaction models that contain a package of intents and utterances that you can add to your skill.

Custom

Design a unique experience for your users. A custom model enables you to create all of your skill's interactions.

Flash Briefing

Give users control of their news feed. This pre-built model lets users control what updates they listen to.

"Alexa, what's in the news?"

Smart Home

Give users control of their smart home devices. This pre-built model lets users turn off the lights and other devices without getting up.

"Alexa, turn on the kitchen lights"

Video

Let users find and consume video content. This pre-built model supports content searches and content suggestions.

"Alexa, play Interstellar"

English

Choose a template

Choose

Select a quick start template to get started with a predefined skill or simply "Start from scratch"

Start from scratch

Design a unique experience for your users and define your custom model from scratch.

Fact Skill

Provided a list of interesting facts about a topic, Alexa will select a fact at random and tell it to the user when the skill is invoked. Includes 1 custom intent, and 4 built-in intents.

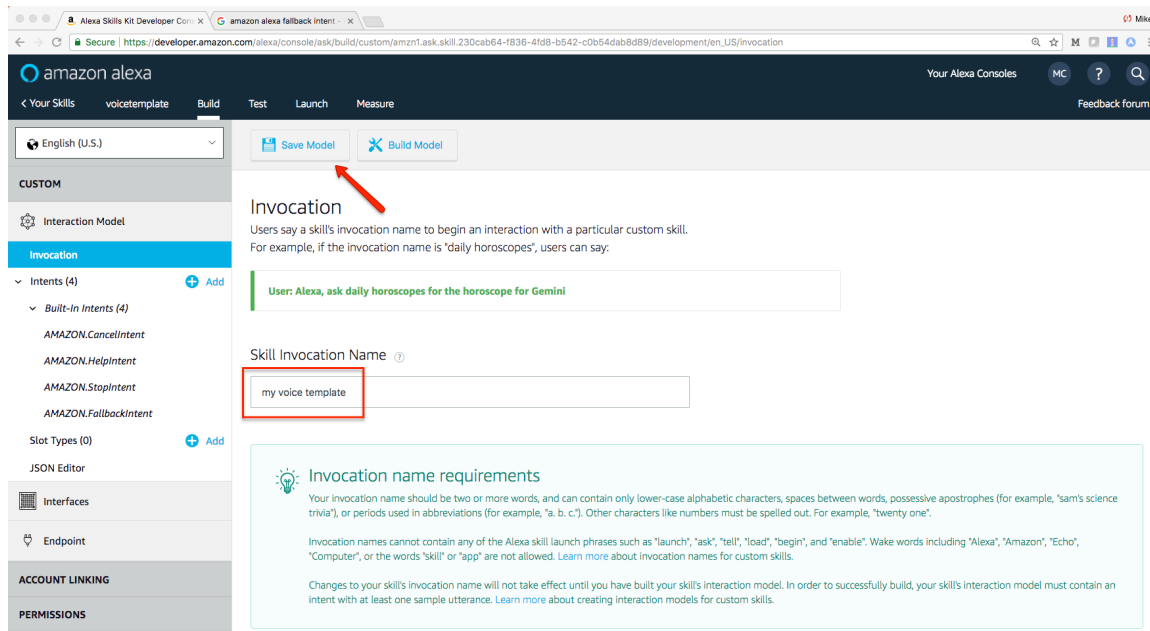

Quiz Game Skill

Provided a list of interesting facts about a topic, Alexa will quiz a user with facts from the list. Includes 1 custom intent with 1 slot, and 6 built-in intents.

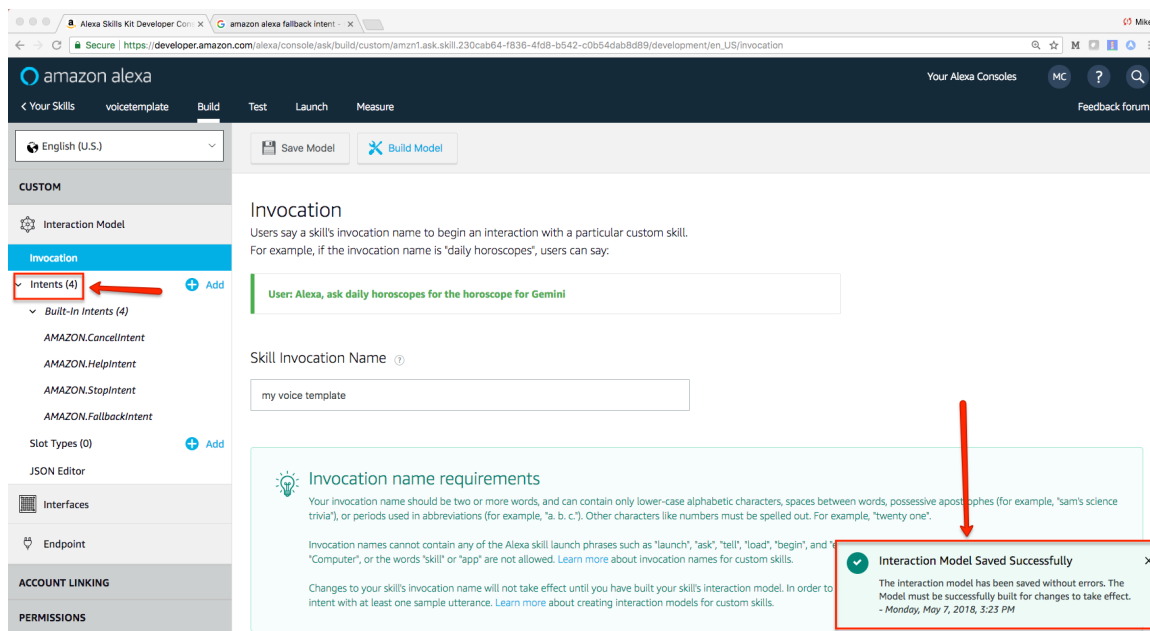

High-Low Game Skill

Try to guess the target number. Alexa tells the player if the target number is higher or lower than their current guess. Includes 2 custom intents with 5 slots, and 5 built-in intents.

Click “Invocation”. Enter “my voice template” for the Skill Invocation name and then click the Save Model button.

A message box will appear when your model is saved successfully. Next, click “Intents” in the left navigation.

Some default intents will automatically be included. We want to add three more. One custom intent and two from Alexa's built in library. To add intents from Alexa's library, click the radio button to "Use an existing intent from Alexa's built-in-library". Search for the name of the intent. Then click the "Add Intent" button next to the proper intent. The two intents you want to add from Alexa's library are: AMAZON.RepeatIntent and AMAZON.StartOverIntent.

## Add Intent

An intent represents an action that fulfills a user's spoken request. [Learn more](#) about intents.

☐ Create custom intent <sup>?</sup>

Enter name for intent

Create custom intent

☒ Use an existing intent from Alexa's built-in library <sup>?</sup>

Search built-ins

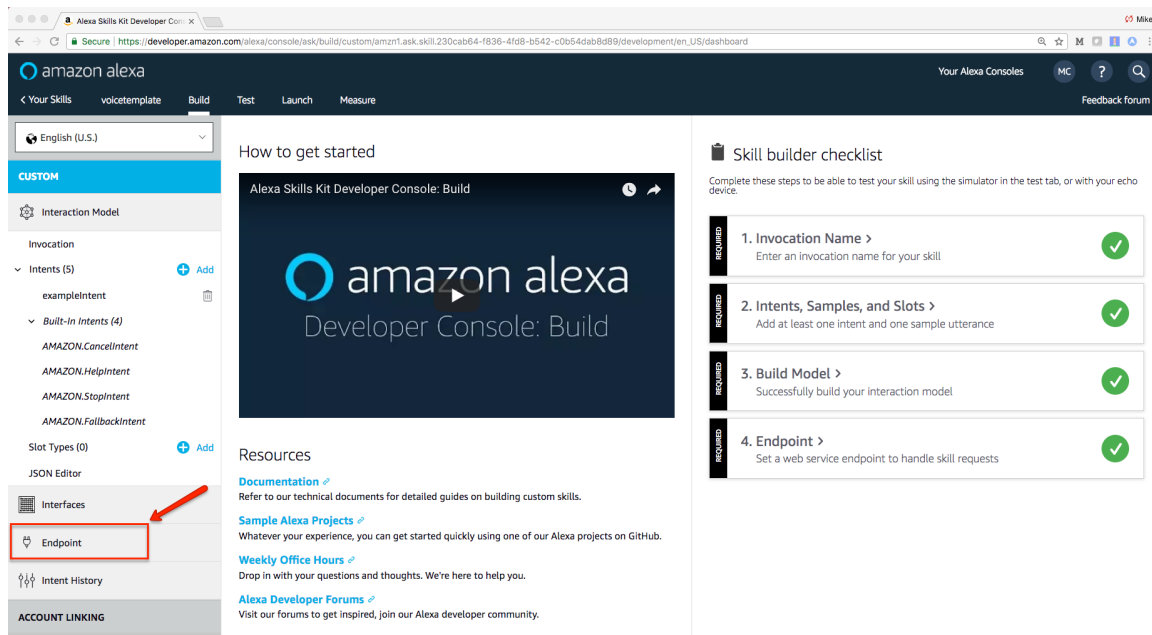

145/145 built-ins

Name	Description
<b>Books</b> 16 built-ins	Intents asking about books and other written works, such as rating books, adding books to reading lists, or navigating through audio books.
<b>Calendar</b> 2 built-ins	Intents for asking about calendars and schedules, such as asking about upcoming events, adding events to a calendar, and looking up events such as birthdays.
<b>Cinema Showtimes</b> 4 built-ins	Intents for asking about show times and events at movie theaters.

Next you will enter an utterance. In the text box enter “example” and then click the plus sign.

The last part is to define your endpoint. Click “Endpoint” in the left navigation.

Select the “HTTPS” radio button. In the “Default Region” section enter:  
[https://your\\_web\\_address/alexaskills/voice\\_template/voicetemplate.cfc?method=start](https://your_web_address/alexaskills/voice_template/voicetemplate.cfc?method=start)  
in the url text box. Ignore the other regions.

### Service Endpoint Type

Select how you will host your skill's service endpoint.

☐ AWS Lambda ARN   
(Recommended)

☒ HTTPS 

Default Region   
(Required)

Enter URI...

Select SSL certificate type

North America   
(Optional)

Enter URI...

Select SSL certificate type

Click the dropdown for “Select SSL certificate type” and pick the one that matches your setup. The second option often works just fine.

Select SSL certificate type 

My development endpoint has a certificate from a trusted certificate authority

My development endpoint is a sub-domain of a domain that has a wildcard certificate from a certificate authority

I will upload a self-signed certificate in X 509 format

Click the “Save Endpoints” button.

## Endpoint

The Endpoint will receive POST requests when a user interacts with your Alexa Skill. The request body contains parameters that your service can use to perform logic and generate a JSON-formatted response. Learn more about AWS Lambda endpoints [here](#). You can host your own HTTPS web service endpoint as long as the service meets the requirements described [here](#).

## Service Endpoint Type

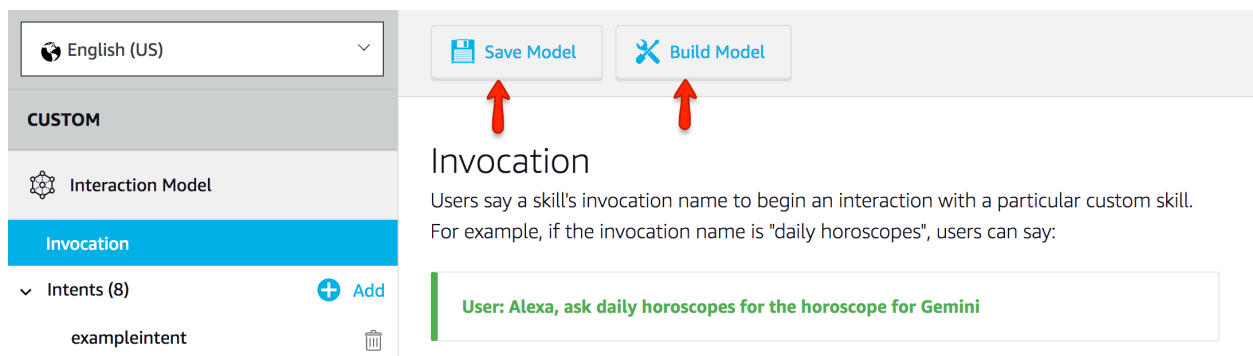

Select how you will host your skill's service endpoint.

- ☐ AWS Lambda ARN <sup>?</sup>  
(Recommended)
- ☒ HTTPS <sup>?</sup>

Default Region

Enter URI...

Finally, you want to build your model. Click on the “Invocation” link in the left hand navigation. Then click the “Save Model” button. Once the save is complete, click the “Build Model” button.

Your voicetemplate skill is now defined and saved on Amazon. Before testing, you need to retrieve your skill ID and copy it to your voicetemplate.cfc code. Click the “Your Skills” link in the top navigation.

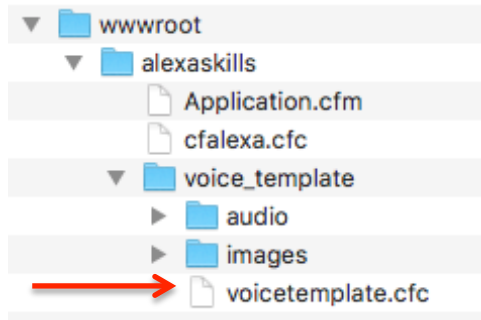

Locate your voicetemplate skill and click on “View Skill ID”.

Copy the ID that appears in the popup box.

Now open your voicetemplate.cfc code.

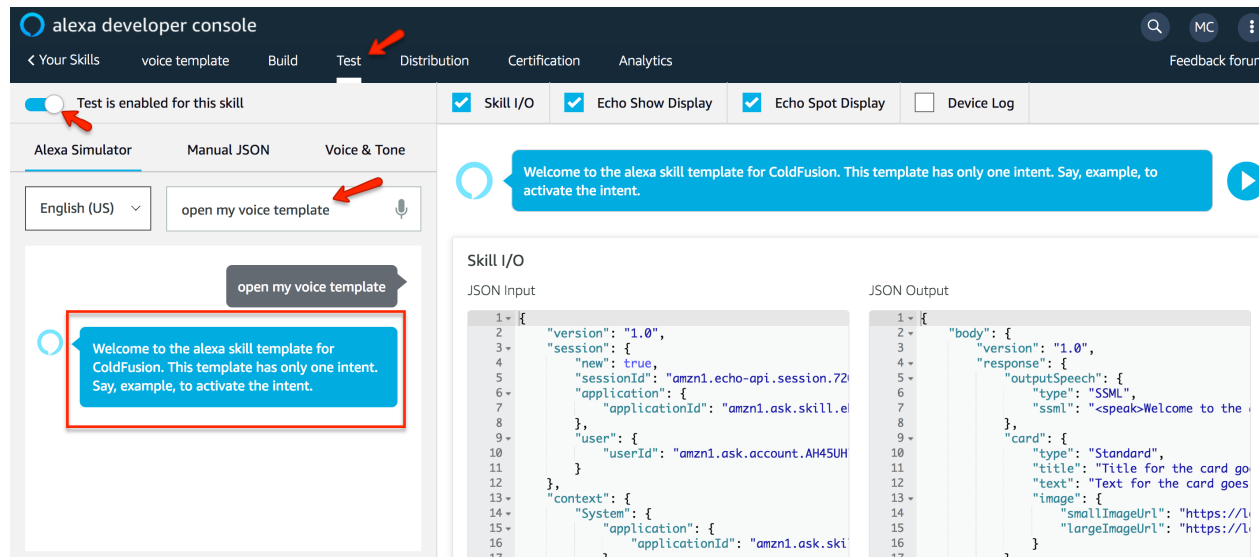

Find the following code and paste in your skill ID. Save your file.

```
<!-- replace the value of skillID with the applicationID of YOUR skill  
from the developers portal --->  
<cfset this.skillID = "{put your skill ID here}">
```

Go back to the developer dashboard. Click on your voicetemplate skill name.

Click the “Test” menu item on the top navigation. Then enable the skill for testing (top left). In the input box type a launch word followed by your invocation name. Example: “open my voice template”. Alexa will send your request to the Amazon cloud where your request will be routed to your endpoint and your voicetemplate.cfc will return a welcome response.

The screenshot shows the Alexa Developer Console interface. At the top, the 'Test' tab is selected. Below the navigation bar, there are tabs for 'Your Skills', 'voice template', 'Build', 'Test', 'Distribution', 'Certification', and 'Analytics'. The 'Test' tab is active, and a toggle switch labeled 'Test is enabled for this skill' is turned on. Below this, there are three tabs: 'Alexa Simulator', 'Manual JSON', and 'Voice & Tone'. The 'Alexa Simulator' tab is selected. In the input box, the text 'open my voice template' is entered. Below the input box, there is a preview of the Alexa interface showing a welcome message: 'Welcome to the alexa skill template for ColdFusion. This template has only one intent. Say, example, to activate the intent.' To the right of the input box, there is a 'Skill I/O' section showing the JSON input and output. The JSON input is a request object with fields like 'version', 'session', 'new', 'sessionId', 'application', 'user', 'context', and 'System'. The JSON output is a response object with fields like 'body', 'version', 'response', 'outputSpeech', 'card', and 'image'.

Your voice template is now up and running. Use it as a building block for your own custom skills. If you want some ideas to get you started, go to <https://www.cfalexa.com/index.cfm#features3-16> to download some code examples.

Good luck and have fun!
